.NET WORKSHOP SERIES

Session: Understanding Frameworks

ROADMAP

T1
What a framework is
T2
How it's different from a library
T3
How to pick the right one
T4
How to learn it without getting lost

THINK OF BUILDING A HOUSE

Framework

Like a house that already has its walls, wiring and plumbing. You decorate the rooms.

Library

Like a toolbox. You pick up a tool only when you need it.

SO, WHAT IS A FRAMEWORK?

A framework is a base of code, tools and rules that you build your app on top of.

Why developers use one:

Saves time, because common problems are already solved

Keeps code neat and consistent

Fewer mistakes, because it follows proven methods

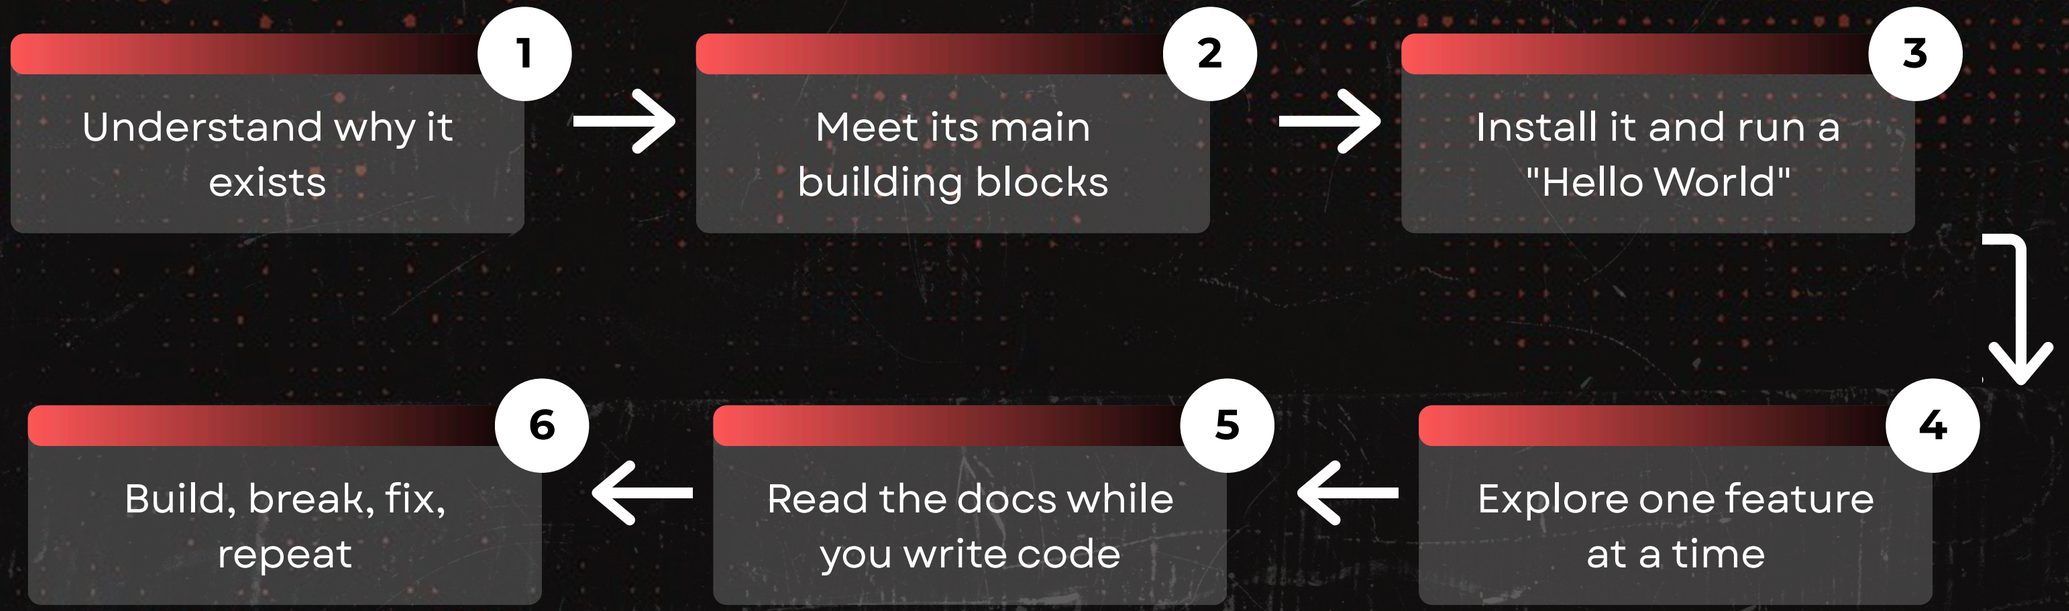

WHO'S DRIVING?

Library: you're the driver. You decide when to use it.

Framework: it plans the route, and you fill in your part.

Feature	Function	Benefit
Smart Task Routing	Auto-prioritization based on urgency & role	Eliminates operational bottlenecks
Contextual Approval	Dynamic flows based on decision patterns	Speeds up approval cycles
Anomaly Detection		
Predictive Timeline	Estimates task/project delays	Improves planning and resource control

YOUR LEARNING PATH

7 QUESTIONS TO ASK BEFORE CHOOSING

1. **What am I building?**
2. **Does it work with a language I know?**
3. **Is help easy to find when I'm stuck?**
4. **How fast can I learn it?**
5. **Can it handle more users later?**
6. **Can I adjust it to fit my needs?**
7. **Do employers ask for it?**

HOW TO SHORTLIST A FRAMEWORK

1. Write down 2–3 options that fit your project
2. See how good their docs and forums are
3. Follow one small tutorial for each
4. Check job listings to see which is more popular

STUDY TIPS

Begin with the official docs and beginner tutorials

Make small practice projects

Ask questions in communities like Stack Overflow or Discord

Stay up to date as new versions come out

WRAP-UP

Remember:

- A framework gives you structure
- A library gives you tools
- Pick one that fits your project, then learn by building
